General Product Information

Product Function and Intended Use

COSEC CPM EM PROX reader is a very compact reader module using contactless passive transponder cards offering long reading distance (max 8-12 cm) despite its compact dimensions. It is fully potted and therefore practically suitable for indoor and outdoor use like access control, parking.

COSEC CPM EM PROX reader module is connected to reader port of door controller (Host product) using RS 232 or wiegand interface. Power to this reader is supplied from the door controller directly to eliminate the need for separate power points at the installation site.

Ratings and System Details

Operating Frequency	120kHz to 130.43 kHz		
Measured RF Output (Worst Case Power)	74.88 dBµV/m	-20.35 dBm	0.00922829 mW
Data rate	115200bps (default 9600bps)		
Modulation	Manchester modulation		
Number of Antennas	Four		
Antenna Type	Coil Antenna		
Supply Voltage	5VDC to 5.5 VDC		
Dimensions in mm	71.4 x 43.4 x 15.2		
Environmental (Storage and Operational conditions)	(-40 to 85°C) operating		

Test Conditions:

Test Voltage: 5 V DC from Adaptor

Environmental conditions: **Temperature:** +23 °C **RH:** 62%

www.tuv.com

Operation Descriptions

The reader module continuously emits RF carrier signals, and keeps observing the received RF signals for data. The presence of a tag modulates the rf field, and the same is detected by the reader.

The passive tag absorbs a small portion of the energy emitted by the reader, and starts sending modulated information when sufficient energy is acquired from the rf field generated by the reader module. The reader demodulates the signals received from the tag antenna, and decodes the same for further processing.

RF Module is tested with following Host systems

1. COSEC DOOR PVR
2. COSEC PATH RDFE/DCFE
3. COSEC NGT FCX
4. COSEC VEGA CAX

www.tuv.com

Test Set-up and Operation Mode

Principle of Configuration Selection

The test was performed under continuous transmit mode to obtain the maximum emissions.

Test Operation and Test Software

- NA

Special Accessories and Auxiliary Equipment

- NA

Note: Matrix COSEC EM PROX Module support the following frequencies

Sl. No.	Frequency (kHz)
1	120.00
2	121.21
3	122.45
4	123.71
5	125.00
6	126.32
7	127.66
8	129.03
9	130.43

Test Methodology

Radiated Emission Test

The radiated emission measurement was performed according to the procedures in ANSI C63.10-2009. The equipment under test (EUT) was placed at the middle of the 80 cm high turntable, and the EUT is 3 meters far from the measuring antenna. The turntable was rotated 360° for obtaining the maximum emission. The height of the measuring antennas was scanned between 1m and 4m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained. The measurement above 1000MHz was performed by horn antenna. The measurement below 30MHz was performed by loop antenna. The EUT was rotated around the X-, Y-, and Z-Axis and the results from worst case axis are recorded.

Conducted Emission Test on A.C. mains line

The equipment under test (EUT) was placed on a wooden table 80cm above the ground plane, the LISN was placed 80cm away from the EUT. The test was performed in accordance with ANSI C63.10: 2009, with the following: an initial measurement was performed in peak and average detection mode on the live and neutral lines. The pre-scan was performed by peak detection on both live and neutral conductors. Any emissions recorded within 20dB of the relevant limit line were re-measured using quasi-peak and average detections, the 6 worst cases were recorded in the table of results.

www.tuv.com

Test Results

Occupied Bandwidth Measurement

Section 15.215 (c)

Measurement procedure

The 99% occupied bandwidth was measured with the spectrum analyzer span set to fully display the emission and approximately 20dB below the peak level. The trace was set to max hold with a peak detector active. The occupied bandwidth measurement function of the analyzer was used for the 99% bandwidth

Measurement Result

Centre Frequency (kHz)	Occupied Bandwidth (kHz)
120.00	3.079
130.43	3.065

Test Plot: Centre Frequency 120 kHz

Test Plot : Center Frequency 130.43 kHz

Spurious Radiated Emissions**Section 15.209****Result****Pass**

Test Specification	FCC Part 15 Section 15.209
Test Method	ANSI C63.10-2009
Supply Voltage	5V DC (Adaptor)
Measuring Frequency Range	9kHz – 1 GHz (Up to 10 th harmonic of the highest fundamental frequency)
Measuring Distance	3m
Requirement	To comply as per limits stated below

Limit for Radiated Emission of Section 15.209:

Frequency (MHz)	Field strength (μV/m)	Field strength (dBμV/m) at 3m range
0.009 – 0.490	2400/F(kHz) (300m range)	48.50 – 13.80 (300m range)*
0.490 – 1.705	24000/F(kHz) (30m range)	33.80 – 23.00 (30m range)*
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
Above 960	500	54.0

Remark: * Distance Correction for Measurements below 30 MHz – Part 15.31

Radiated measurements were performed at a distance closer than 300 meters and 30m as required, according to Part 15.209. Therefore a correction factor was applied to account for propagation loss at the specified distance. The propagation loss was determined by using the square of an inverse linear distance extrapolation factor (40dB/decade) according to 15.31. A sample calculation of the distance correction factor is shown below for limits expressed at a 300m measurement distance and a 30m measurement distance.

$$\begin{aligned}\text{Distance correction factor (300m Specified Test Distance)} &= 40 \cdot \log(\text{Test Distance}/300) \\ &= 40 \cdot \log(3/300) \\ &= -80 \text{ dB}\end{aligned}$$

$$\begin{aligned}\text{Distance correction factor (30m Specified Test Distance)} &= 40 \cdot \log(\text{Test Distance}/30) \\ &= 40 \cdot \log(3/30) \\ &= -40 \text{ dB}\end{aligned}$$

The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9–90 kHz, 110–490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

Test Results for COSEC CPM EM PROX module:

Spurious emissions in the frequency range 9 kHz to 30 MHz – Standard LF Coil Antenna

Spurious emissions are found to be worst for the fundamental frequency 130.43KHz & same are listed in the below table.

Antenna Polarization	Emission Frequency (kHz)	Field Strength (dBµV/m)	Limit (dBµV/m)	Margin (dB)
Parallel	119.5*	68.48	106.05	-37.57
	130.6*	74.88	105.28	-30.40
	370.0	46.27	96.24	-49.97
	620.0	40.99	71.75	-30.76
	865.0	37.20	68.86	-31.66
	1114	35.03	66.66	-31.63
	1360	32.51	64.93	-32.42
Perpendicular	119.5*	64.12	106.05	-41.93
	130.6*	67.98	105.28	-37.30
	370.0	43.95	96.24	-52.29
	620.0	38.85	71.75	-32.90
	865.0	35.25	68.86	-33.61
	1114	32.38	66.66	-34.28
	1360	32.58	64.93	-32.35

* > Fundamental Frequency

Spurious emissions in the frequency range 9 kHz to 30 MHz – NGT LF Coil Antenna

Spurious emissions are found to be worst for the fundamental frequency 130.43KHz & same are listed in the below table.

Antenna Polarization	Emission Frequency (kHz)	Field Strength (dBµV/m)	Limit (dBµV/m)	Margin (dB)
Parallel	119.6*	60.05	106.04	-45.99
	130.3*	64.62	105.30	-40.68
	71.4	24.96	110.53	-85.57
	370.0	36.15	96.24	-60.09
	620.0	31.75	71.75	-40.00
Perpendicular	119.6*	55.76	106.04	-50.28
	130.2*	59.46	105.31	-45.85
	370.0	33.25	96.24	-62.99

* > Fundamental Frequency

Spurious emissions in the frequency range 9 kHz to 30 MHz – Premium LF Coil Antenna

Spurious emissions are found to be worst for the fundamental frequency 130.43KHz & same are listed in the below table.

Antenna Polarization	Emission Frequency (kHz)	Field Strength (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)
Parallel	71.3	25.41	110.54	-85.13
	120.1*	62.12	105.31	-43.19
	130.4*	67.65	105.29	-37.64
	370.0	40.47	96.24	-55.77
	620.0	36.65	71.75	-35.1
	865.0	33.60	68.86	-35.26
Perpendicular	120.1*	61.78	105.31	-43.53
	130.3*	64.56	105.30	-40.74
	370.0	37.22	96.24	-59.02
	620.0	37.22	71.75	-34.53
	865.0	31.28	68.86	-37.58

* > Fundamental Frequency

Spurious emissions in the frequency range 9 kHz to 30 MHz – CDC FP LF Coil Antenna

Spurious emissions are found to be worst for the fundamental frequency 130.43KHz & same are listed in the below table.

Antenna Polarization	Emission Frequency (kHz)	Field Strength (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)
Parallel	71.3	24.79	110.54	-85.75
	119.8*	59.56	106.03	-46.47
